Abstract

Beginning the fall semester 2007, the Purdue School of Engineering and Technology on the Indiana University Purdue University Indianapolis (IUPUI) began offering a Master of Science in Technology degree program with a Facilities Management Specialization. While the general M.S. Technology degree program is a traditional program incorporating on-campus course delivery, Facilities Management specialization is a 100% on-line program designed for the working student. The program’s curriculum provides an integrated experience in facilities management with emphasis on project and contract management, engineering systems management and energy management. This poster details lessons learned through the development of the M.S. Technology, Facilities Management specialization degree program from inception to graduates.
