Designed for students of superior ability and motivation, this course covers the same core material as E202 and substitutes for E202 as a prerequisite for other courses. The course covers standard material—national income accounting, theories and evidence about long-run economic growth, macroeconomic data, explanations for short-run business cycles fluctuations, aggregate supply/demand, and international economics—but moves well beyond introductory textbook presentations. Particular emphasis is placed on modern, dynamic views of macroeconomic policies—monetary and fiscal policies to understand the economic challenges many countries face now and in coming decades. Abstract theories are tied concretely to economic data from the diverse economic experiences of countries over time. Students are expected to be comfortable with mathematical notation and with interpreting and manipulating graphs and algebraic expressions.
