Meet second eight weeks, and with COLL-L 100.

Students! Interested in an exciting new way to take an introductory science course in a spectacular mountain setting? Through the support of the Collins Living-Learning Center, the Dept. of Geological Sciences, and the College of Arts & Sciences, we will be again offering our introductory-level "expeditions" science course, directed at both science and non-science students, and taught in the mountains of the eastern Sierra Nevada. The course, entitled "Volcanoes of the Eastern Sierra Nevada: Geology and Natural History of the Long Valley Caldera," is open to all students on the IU campus. The course will be taught by Michael Hamburger, professor of Geological Sciences and John Rupp, research scientist with the Indiana Geological Survey. The class offers a hands-on, inquiry-oriented introduction to the geological and ecological setting of one of the most beautiful and environmentally diverse areas of the western U.S.

Students can register for the class either as GEOL-G 190 or through the Collins Living-Learning Center (COLL-L 100). Both listings are eligible for College CASE and N&M sciences credit. Consent of instructor is required in advance. For more information and to obtain authorization, students must apply on-line at http://www.indiana.edu/~sierra/.

Above class is open only to those students interested in participating in the 2-week (3 CR) field course to the Sierras, Volcanoes of the Eastern Sierra Nevada, during Summer I (May 16 – 30, 2015).

Questions? Contact Michael Hamburger (hamburg@indiana.edu) with any questions about the class.
