IU Incubator Building
Sustainable Sites Credit 7.2: Heat Island Effect, Roof

Design Application Review: The LEED Submittal Template has been provided stating that the roofing materials used on the project are compliant with SRI values for a minimum of 75% of the roof surface. However, the roof plan provided does not highlight the area of SRI compliant roofing material.

Technical Advice:
Please provide the required roof plan (with scale) highlighting the area of SRI compliant roofing material.

Response:
A new roof plan, file: A130-roof plan-SS credit 7.2, has been uploaded to reflect the technical advice given above. The new 1/8"=1'-0" roof plan has a hatch that represents the area of roof that will have SRI compliant roofing material. A note pointing to each roof area describes the amount of overall roof that is SRI compliant.

We hope the attached narrative address the USGBC reviewer's request for additional information.

Sincerely,

Jeremy Welu
LEED Administrator
